RAG Effectiveness Across Knowledge Domains

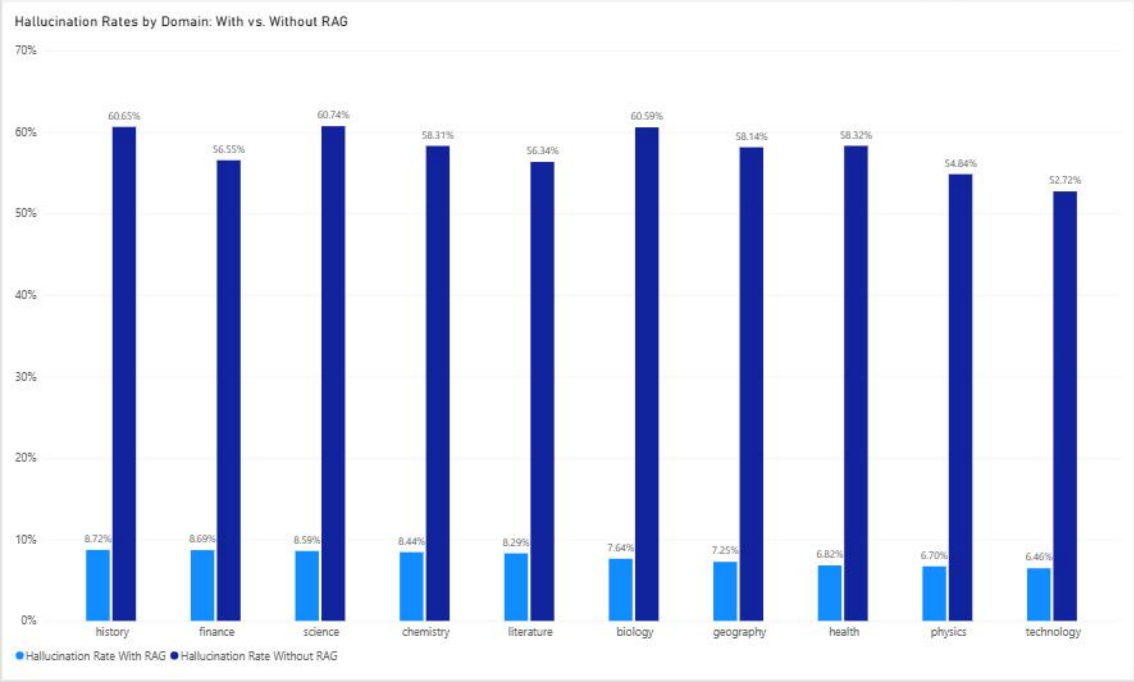

Hallucination Rate Without RAG	Hallucination Rate With RAG	Reduction (percentage points)
57.6%	7.7%	49.9 pp

About This Analysis

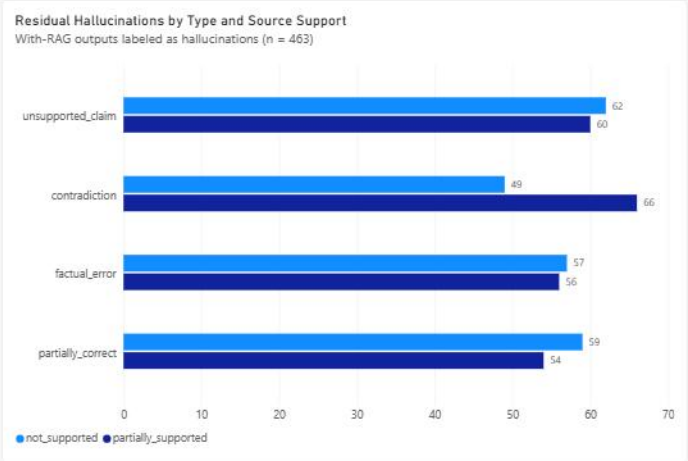

Retrieval-Augmented Generation (RAG) provides large language models with retrieved information to support their responses. This dashboard examines how RAG affects hallucination rates across ten knowledge domains using 6,000 samples from a Kaggle dataset.

Results reflect the provided dataset and should not be interpreted as universal RAG performance benchmarks.

Domain sample sizes vary. Hover over a domain to see its sample count, and interpret rate differences in that context.

hallucination_type	not_supported	partially_supported	Total
unsupported_claim	62	60	122
contradiction	49	66	115
factual_error	57	56	113
partially_correct	59	54	113
Total	**227**	**236**	**463**

Of 463 With-RAG outputs labeled as hallucinations, 227 (49.0%) were labeled not supported and 236 (51.0%) partially supported. Contradictions showed the largest split: 66 partially supported versus 49 not supported. These are descriptive patterns, not evidence of cause.
